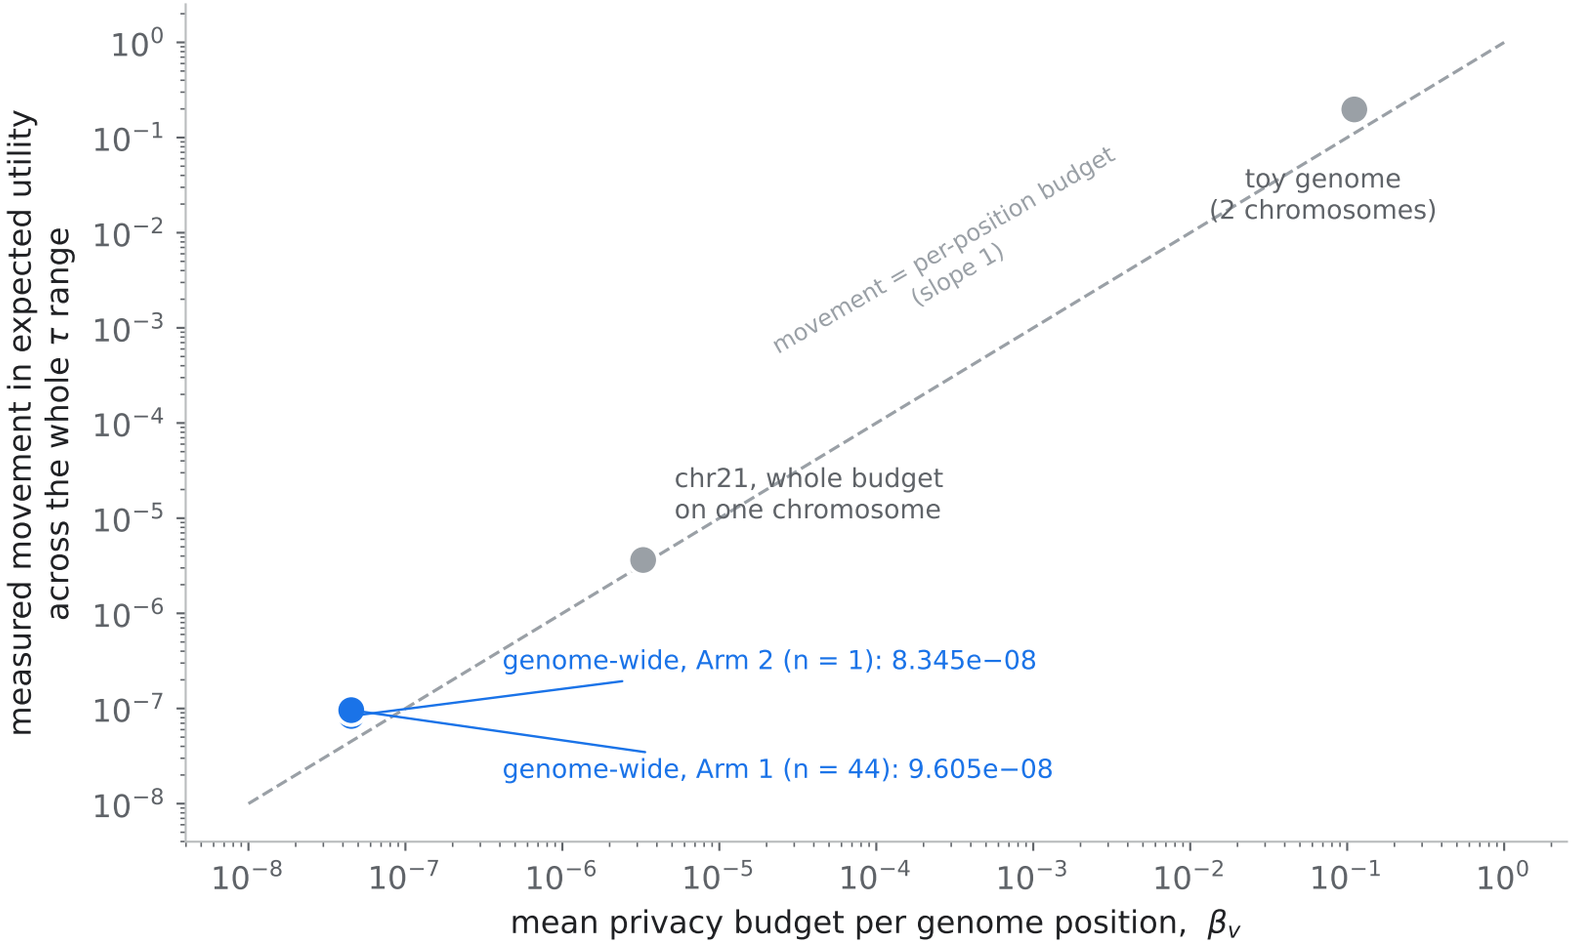
The effect is budget dilution: movement tracks the per-position budget across six orders of magnitude — and the two arms land together



Each point is an exact measurement on a different scope. The two genome-wide points are INDEPENDENT experiments — a single external target (Arm 2) and 44 held-out cohort members (Arm 1) — measured on different days by different code paths, agreeing to 15%. Provenance: logs/B_toy_genome_demo.md, logs/B_beta_concentration.md, logs/B_exact_utility.md, logs/B_arm1_results.md
