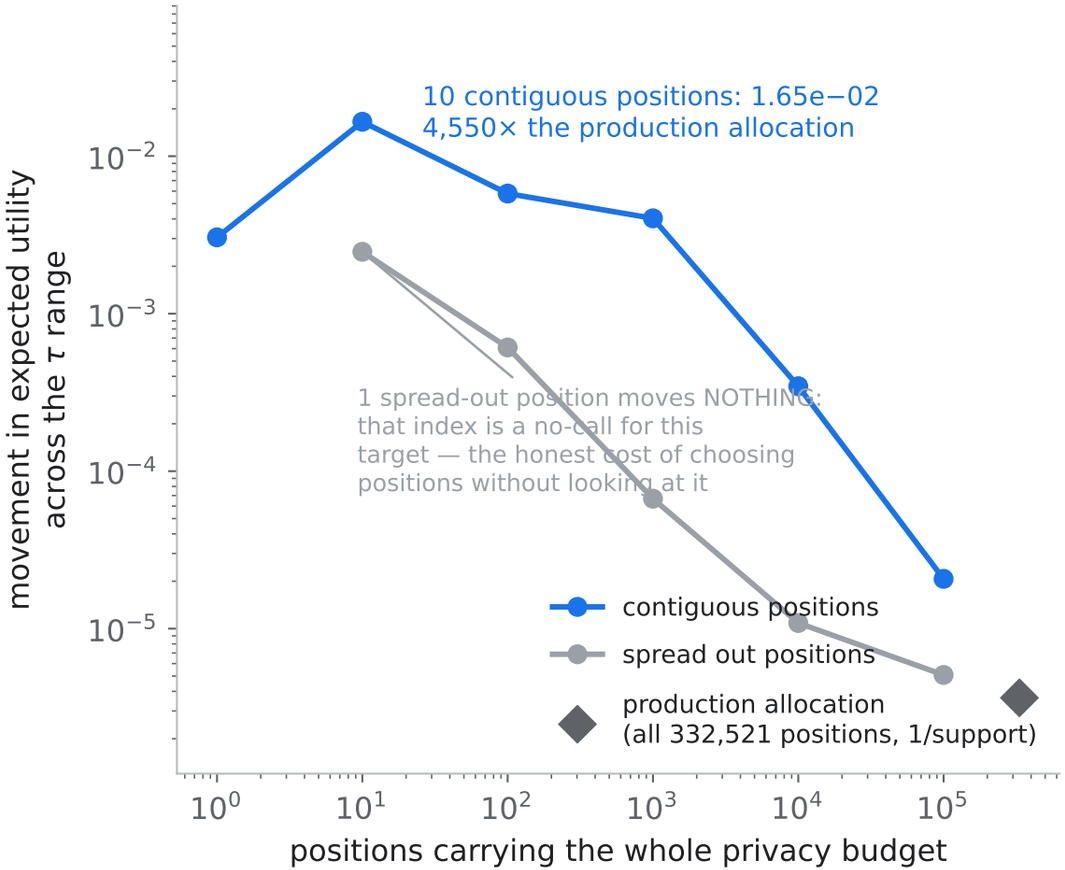
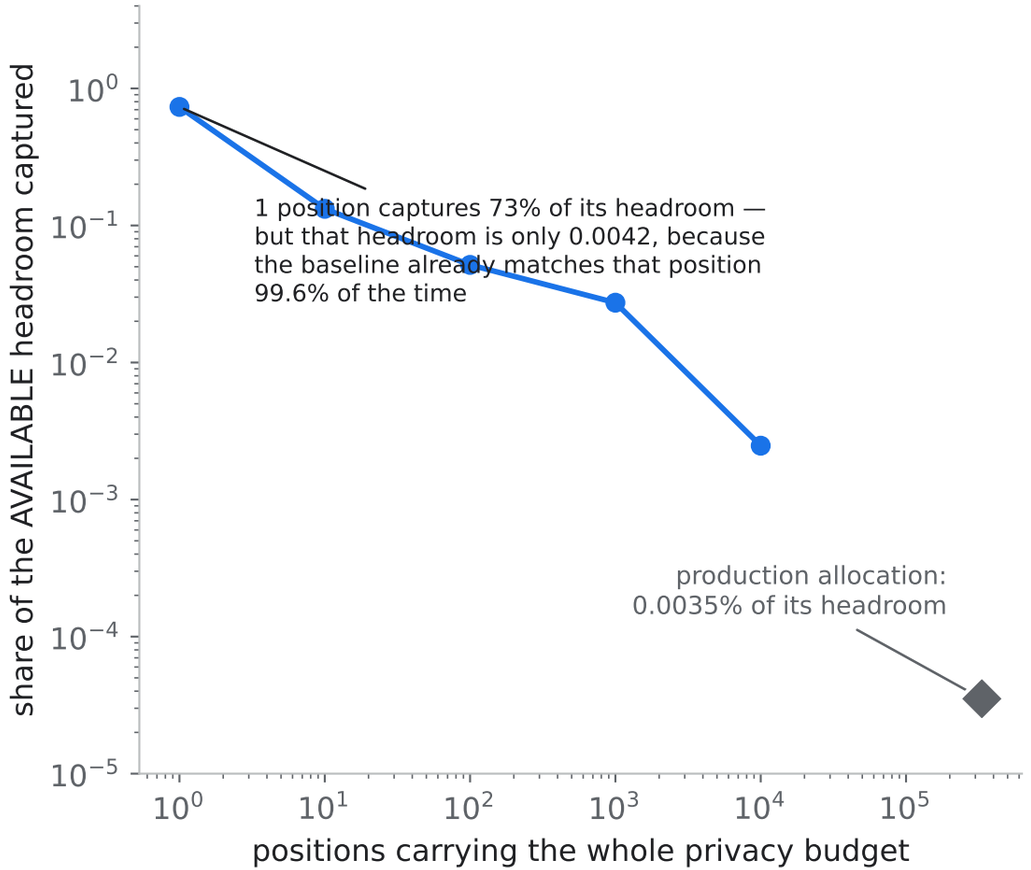
Concentrating the budget buys up to 4,550× the movement — and is privacy-NEUTRAL



But the positions where the tilt has power are the ones that needed it least



chr21, T = 332,521, K = 88, target HG00096, ARM 2, whole budget on one chromosome. 14 allocations × 3 τ, exact.

⚠ EVERY allocation sums to 1, so δ_u = 1 and τ, η_τ, ε_τ and p_succ_bound are IDENTICAL on every row: reallocation is privacy-neutral.

⚠ It does not improve utility, it REDEFINES it — each allocation is a different utility function, so levels are not comparable across rows (constraint 8).

⚠ The positions must be chosen WITHOUT looking at the target, or Theorem 1 is void (constraint 1). ⚠ β is a pre-registered field: changing it needs a NEW dated pre-registration. Provenance: logs/B_beta_concentration.md
